

J-Tec Material Handling supplies starch production lines for Cargill-AKV I/S

Last year, Cargill-AKV I/S selected J-Tec as a supplier for their new potato starch production line in Denmark. This new line will be able to process the potato starch in different ways, so the best quality will be assured in various applications.

J-Tec Material Handling provided storage silos for both the intermediate and finished product, liquid tanks, separators, mixers, and hygienic control (sieve, magnet and sampling). To fit the new production line in the existing building, the storage silos were installed on top of the building. J-Tec also delivered the complete Cleaning In Place (CIP) system for the cleaning of the installation. Extra attention was paid to optimal water purification and low waste of water.

The production line is expected to be operational by the second quarter of 2018.
